

- Master-/Bachelor thesis - Finger Image Quality

CASED	In CASED (Center for Advanced Security Research Darmstadt) Technische Universität Darmstadt, Fraunhofer Institute for Secure Information Technology and the University of Applied Sciences Darmstadt collaborate in the fast developing field of IT Security. In a unique cooperation, which combines different areas of expertise from these renowned institutions, progressive IT security solutions are researched, developed and implemented into industrial economy: CASED brings together computer scientists, engineers, physicists, legal experts and business economists. Background	Authentication and identification using fingerprints as a biometric characteristic has seen increasing usage over the past decades in a wide range of scenarios, spanning access control in recreational resorts and fitness centers, to identification of individuals in border control and forensic investigations. Fingerprints are present in these systems and widely adopted because of their ubiquity, uniqueness and relative ease of acquisition. Fingerprint recognition is based on the detection and comparison of features inherent in the fingerprint. These features include, amongst others, the global flow of ridges, local ridge structural characteristics, and intra-ridge structures such as sweat pores. These features are negatively affected, to various degrees, by defects in the dermal layer and circumstances specific to the capturing situation. Depending on the degree of the potential image quality degradation, this results in a biometric performance reduction and thus a lower system performance. Finger image quality is defined as: "a predictor of a matchers performance". The matcher's performance is strictly assessed through the similarity scores and the separation of match and non-match distributions. Fingerprints with a high quality score are expected to have a high comparison score which will be well separated from the non-match distribution. The quality score should thus convey the predicted sample utility which in turn should be correlated with the observed utility.
Task	<ul style="list-style-type: none">• Apply image/signal analysis or machinelearning techniques to extract quality features• Assess the predictive performance of the found features
Prerequisites	<ul style="list-style-type: none">• Interest in image and signal analysis• Familiar with Matlab, OpenCV• Desire to contribute to international standards
Start	<ul style="list-style-type: none">• Immediately
